September and October Garden Guide

The most important job in the garden from September until the end of the year is preparing and planting bulbs for Spring color in the garden. Let's start with adobe soils which are quite prevalent in the Bay Area. Bulbs have quite a hard time getting started in this type of ground. Tulips and Hyacinths seem to have most trouble. Suppose we start a bed of tulips three feet by three feet. They should be planted six inches apart in the row and six inches between the rows. This means a bed of this size requires three dozen tulips. Tulips should be planted about six inches deep. So we dig holes eight inches deep and drop in two inches sand, plant bulb, then two more inches sand, then cover to the old soil level with the native soil. Into the total sand surrounding the bulb there should be mixed one heaped teaspoon of bone meal. This is the only fertilizer we recommend with bulbs at this time. After the bed has been completely planted with tulips, rake the surface as fine as possible. In order to complete this picture we then proceed to plant the ground cover. We like *Linaria Fairy Bouquet* best of all but this is a matter of taste. Listed in this guide you will find various bulb ground cover seeds. Mix $\frac{1}{8}$ ounce *Linaria* with about ten times its volume of sand and scatter over the 3 x 3 Tulip bed. Rake lightly and irrigate. This will give you a spring show which will be a delight to the eye and the heart. Talking about Tulips, try the Botanical Red Emperor. Quite the most beautiful Tulip we've ever seen. Daffodils, of course, are a splendid investment because they do not need to be disturbed for four or five years. Plant them about six to eight inches deep so that Asters, Zinnias, etc., can be planted over them for summer and fall flowers. Those of you starting new gardens call, phone or write us. We frequently have small planting stock priced very reasonably which will give great satisfaction for years.

If you want to try bulbs indoors, stick to Daffodils and Hyacinths. We have special bulb Fibre for this purpose which enables you to plant in china bowls. Keep the bowl in the cooler for the first four weeks and thereafter cool room conditions and plenty of light are necessary.

We hope you will patronize us for bulbs. Our quality and prices are in line and our mail order department is ready to serve you.

Many perennial seeds such as Delphiniums, Columbines, etc., should be started in flats now or in a good sheltered seed bed outdoors. Remember a good flat mixture is one part each leaf mold, sand, peat moss and good garden soil.

Our new crop Cyclamen seed is en route from Europe. Cyclamen are surprisingly easy to grow and can be readily used for outdoor bedding in somewhat the same situation as Cinerarias. Try them for something really different outside. About twenty-five seeds for one dollar is a worthwhile buy.

Now we must say a few words about lawns. We find the brown patches in lawns this year to be caused in most cases by the crambus moth. This little moth, brownish, about the size of a dime and active mostly before dusk, lays an egg in your lawn; this egg hatches into a grub which is the little fellow who does the damage. He eats the chlorophyll (the green stuff) out of the blades of grass—then brown patches. Control is quite simple. One pound of Niagara 50% Wettable to every five hundred square feet of lawn gives a good residual effect. Mix it with your fertilizer or with sand in order to obtain even distribution. Older lawns require attention at this time of year. If the lawn does look ragged it should be raked hard each way with a steel garden rake. Remove all dead stuff and sow some KXL lawn grass to thicken and make the lawn have a much improved appearance. If making a new lawn please get in touch with us. We can save you much grief in after years with proper advice regarding the seed bed. You will find all the different grasses detailed in this guide.

The Niagara 6% Wettable Chlordane is giving perfect control on Earwigs, Ants and the green striped flying beetle (*Diabrotica*) where properly applied. Be sure to stop the ants going up trees. They are responsible for many of the insects and diseases. An occasional dusting with our 6% Chlordane will take care of this problem. You cannot be sure ants are not present if you do not make a thorough examination of the trunk of the shrubs and trees and all points which touch fences and buildings. Keep in mind that prevention is better than cure.

September is about the last month to fertilize Camellias. No more should be applied until after flowering time. Most of the experts use Likwid GRO. It is acid and it is organic. Be sure to use it on Camellias, Rhododendrons, Azaleas and Daphne for better Spring blooms.

In previous guides we have stressed soil fumigation. We are still sold on this procedure before making new plantings. We now have Soil fume caps. These are capsules containing Ethylene Dibromide. They are placed into the soil about six inches deep and about one foot apart. Cover up and irrigate. Gradually the capsule dissolves and the gas is freed. In ten days plantings can be made and freedom from insects for a considerable period is assured.

About the beginning of September the peach tree borer starts activity again. This insect bores into the tree near or just below the soil level. On trees up to about five years of age, a half ounce of Paradichloro Benzene should be put in a circle about one foot from the trunk in a furrow, cover up and irrigate. On older trees, use one ounce of this material. Do this before the end of November.

We hope our fall weather will give us a real Indian Summer. Remember there is no need to be troubled by mosquitoes, hornets or wasps in your outdoor living. A general dusting in the shrubbery and trees with Niagara 50% Wettable DDT is very effective control.

We want to apologize for omitting our Garden Guide during the past two months. Sickness is our excuse.

Please submit names and addresses of friends who might benefit from this guide. We will be glad to mail it to them.
